Bumper Bollards: EAS Gate Pedestal Protection

Every retail environment is different and some are more challenging than others. High consumer traffic, shopping carts and pallet traffic all present durability issues for any EAS system. To protect the pedestals and increase the reliability factor of the system operation, bumper bollards/ trolley posts are often installed to displace the potential damage from the more costly electronics of the pedestal to a clean, stainless steel bollard. Combined with the riser base included on all pedestal systems in harsh environments, pedestal life is extended significantly.

Features

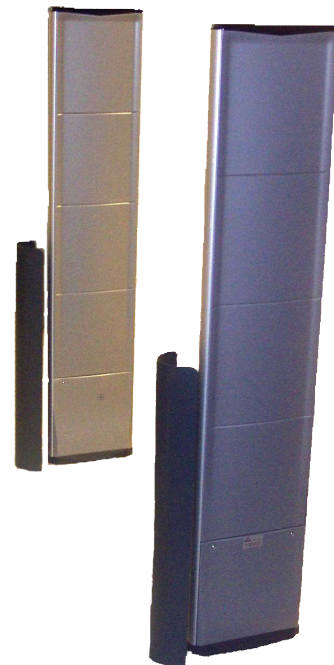

- Stainless steel construction provides clean look
- Shopping cart and pallet traffic do not impact pedestals
- Extended pedestal life
- Reduced service issues due to contact damage
